1 Assignment 2 - Network Connectivity

In this assignment you will go through the process of importing and analyzing an internal email communication network between employees of a mid-sized manufacturing company. Each node represents an employee and each directed edge between two nodes represents an individual email. The left node represents the sender and the right node represents the recipient.

1.0.1 Question 1

Using networkx, load up the directed multigraph from `email_network.txt`. Make sure the node names are strings.

This function should return a directed multigraph networkx graph.

```
In [10]: import networkx as nx

# This line must be commented out when submitting to the autograder
#!head email_network.txt

In [11]: def answer_one():

    # Your Code Here
    #df = pd.read_txt('email_network.txt')
    #df
    import pandas as pd
    df = pd.read_csv('email_network.txt', delimiter = "\t")
    df = df.astype({'#Sender': str, 'Recipient': str})
    df
    senders_recipients = list(df['#Sender']) + list(df['Recipient'])
    edges = list(zip((df['#Sender']), (df['Recipient'])))
    #senders = set(df['#Sender'])
```

```

#recipients = set(df['Recipient'])
edges = set(edges)
#G = nx.from_pandas_dataframe(df, '#Sender', 'Recipient', create_using=nx.MultiDiGr
df['weight'] = df.groupby(['#Sender', 'Recipient'])['#Sender'].transform('size')
G = nx.MultiDiGraph()
for index, row in df.iterrows():
    G.add_edge(row['#Sender'],row['Recipient'],weight=row['weight'])

#G = nx.from_pandas_dataframe(df, '#Sender', 'Recipient', edge_attr='weight', create_

return G#.edges(data=True)# Your Answer Here
#answer_one()

```

1.0.2 Question 2

How many employees and emails are represented in the graph from Question 1?

This function should return a tuple (#employees, #emails).

```

In [12]: def answer_two():
import pandas as pd
df = pd.read_csv('email_network.txt', delimiter = "\t")
df = df.astype({'#Sender': str, 'Recipient': str})
G = answer_one()
print(type(G))
emails = len(G.edges(data=True))
senders_recipients = list(df['#Sender']) + list(df['Recipient'])
employees = set(senders_recipients)

# Your Code Here

return len(employees), emails# Your Answer Here
#answer_two()

```

1.0.3 Question 3

- Part 1. Assume that information in this company can only be exchanged through email.
When an employee sends an email to another employee, a communication channel has been created, allowing the sender to provide information to the receiver, but not vice versa.
Based on the emails sent in the data, is it possible for information to go from every employee to every other employee?
- Part 2. Now assume that a communication channel established by an email allows information to be exchanged both ways.
Based on the emails sent in the data, is it possible for information to go from every employee to every other employee?

This function should return a tuple of bools (part1, part2).

```
In [13]: def answer_three():

    # Your Code Here
    G = answer_one()
    part1 = nx.is_strongly_connected(G)
    part2 = nx.is_weakly_connected(G)

    return part1,part2# Your Answer Here
#answer_three()
```

1.0.4 Question 4

How many nodes are in the largest (in terms of nodes) weakly connected component?
This function should return an int.

```
In [14]: def answer_four():

    # Your Code Here
    G = answer_one()
    components = sorted(nx.weakly_connected_components(G))

    return G.number_of_nodes()# Your Answer Here
#answer_four()
```

1.0.5 Question 5

How many nodes are in the largest (in terms of nodes) strongly connected component?
This function should return an int

```
In [31]: def answer_five():

    # Your Code Here
    G = answer_one()
    #components = sorted(nx.strongly_connected_components(G))
    #length = 0
    #for component in components:
        #if len(component) > length:
            #length = len(component)
    #a = {'d'}
    largest = max(nx.strongly_connected_components(G), key=len)
    return len(largest)# Your Answer Here
answer_five()
```

Out[31]: 126

1.0.6 Question 6

Using the NetworkX function `strongly_connected_component_subgraphs`, find the subgraph of nodes in a largest strongly connected component. Call this graph `G_sc`.
This function should return a networkx MultiDiGraph named `G_sc`.

```
In [32]: def answer_six():

    # Your Code Here
    G = answer_one()
    #components = nx.strongly_connected_components(G)
    #length = answer_five()
    G_sc = max(nx.strongly_connected_component_subgraphs(G), key=len)
    #sub_components = nx.strongly_connected_component_subgraphs(set_1)
    return G_sc# Your Answer Here
#answer_six()
```

```
Out[32]: <networkx.classes.multidigraph.MultiDiGraph at 0x7f5cb8fad50>
```

1.0.7 Question 7

What is the average distance between nodes in G_sc?

This function should return a float.

```
In [33]: def answer_seven():

    # Your Code Here
    G_sc = answer_six()
    average = nx.average_shortest_path_length(G_sc)
    return average# Your Answer Here
#answer_seven()
```

```
Out[33]: 1.6461587301587302
```

1.0.8 Question 8

What is the largest possible distance between two employees in G_sc?

This function should return an int.

```
In [34]: def answer_eight():

    # Your Code Here
    G_sc = answer_six()
    diameter = nx.diameter(G_sc)

    return diameter# Your Answer Here
#answer_eight()
```

```
Out[34]: 3
```

1.0.9 Question 9

What is the set of nodes in G_sc with eccentricity equal to the diameter?

This function should return a set of the node(s).

```
In [60]: def answer_nine():
```

```
    # Your Code Here
    G_sc = answer_six()
    periphery = nx.periphery(G_sc)
    return set(periphery) # Your Answer Here
#answer_nine()
```

```
Out[60]: {'129', '134', '97'}
```

1.0.10 Question 10

What is the set of node(s) in G_{sc} with eccentricity equal to the radius?

This function should return a set of the node(s).

```
In [62]: def answer_ten():
```

```
    # Your Code Here
    G_sc = answer_six()
    center = nx.center(G_sc)

    return set(center) # Your Answer Here
#answer_ten()
```

```
Out[62]: {'38'}
```

1.0.11 Question 11

Which node in G_{sc} is connected to the most other nodes by a shortest path of length equal to the diameter of G_{sc} ?

How many nodes are connected to this node?

This function should return a tuple (name of node, number of satisfied connected nodes).

```
In [56]: def answer_eleven():
```

```
    # Your Code Here
    G_sc = answer_six()
    diameter = nx.diameter(G_sc)
    nodes = answer_nine()
    peripheries = nx.periphery(G_sc)
    max_count = -1
    result_node = None
    for node in peripheries:
        count = 0
        sp = nx.shortest_path_length(G_sc, node)
        for key, value in sp.items():
            if value == diameter:
                count += 1
        if count > max_count:
```

```

        result_node = node
        max_count = count

    return result_node, max_count
    #target = None
    #for node in nodes:
        #target = [k for k,v in nx.shortest_path_length(G_sc, node).items() if v == dia
    #number_of_nodes = G_sc.degree[shortest]
    #return target#nx.shortest_path_length(G_sc, '38')#,number_of_nodes# Your Answer Here
    #answer_eleven()

```

Out[56]: ('97', 63)

1.0.12 Question 12

Suppose you want to prevent communication from flowing to the node that you found in the previous question from any node in the center of `G_sc`, what is the smallest number of nodes you would need to remove from the graph (you're not allowed to remove the node from the previous question or the center nodes)?

This function should return an integer.

```

In [57]: def answer_twelve():

    # Your Code Here
    G_sc = answer_six()
    center = nx.center(G_sc)[0]
    node = answer_eleven()[0]
    return len(nx.minimum_node_cut(G_sc, center, node))
    #answer_twelve()

```

Out[57]: 5

1.0.13 Question 13

Construct an undirected graph `G_un` using `G_sc` (you can ignore the attributes).

This function should return a networkx Graph.

```

In [58]: def answer_thirteen():

    # Your Code Here
    G_sc = answer_six()
    un_subgraph = G_sc.to_undirected()
    G_un = nx.Graph(un_subgraph)

    return G_un# Your Answer Here
    #answer_thirteen()

```

Out[58]: <networkx.classes.graph.Graph at 0x7f5cbb01e5f8>

1.0.14 Question 14

What is the transitivity and average clustering coefficient of graph G_{un} ?

This function should return a tuple (transitivity, avg clustering).

```
In [59]: def answer_fourteen():  
  
         # Your Code Here  
         B = answer_thirteen()  
  
         return nx.transitivity(B), nx.average_clustering(B) # Your Answer Here  
         #answer_fourteen()
```

```
Out[59]: (0.570111160700385, 0.6975272437231417)
```
